

Car wax and its uses

Car wax is a greasy substance used to polish the surface of car. Car wax may be further categorized into various types depending upon the chemicals that have been used in them and are usually used after a car is cleaned of all its dirt etc. There are many types of car wax available usually at the car wash centers and one may ascertain which brand he requires but it is advisable to check whether the car wax can be applied to surfaces like plastic, leather or metal. One can easily see the most expensive cars being polished with car wax and one should not carry a misnomer that only the cheap cars are taken care of by polishing them with car wax. The main reason for such a trust in car wax is excellent result without any damage to the surface.

The purpose of polishing with car wax is to remove oxidation, swirls, scratches, water deposits, and other imperfections from the various surfaces with paint of metallic finish. The function is not restricted only to removing contamination from surfaces but also removing surface imperfections and smoothing the surface. Polishing using a car wax is a time taking yet a very enjoyable activity for vehicle owners who can not bear with even the lightest of surface imperfection.

[Car wax](#) and polish were considered to be different earlier. While car wax takes care primarily of the oxidation of metallic parts, polish is a cleaning compound that removes impurities from the paint which prepares it for waxing, sealing, or protecting. But now days new ambivalent chemicals have arrived that can fulfill the above purpose on single application.

Car wax ameliorates the gloss and depth of the painted surface which now appears to shine more and the new layer of wax gives more protection to the surface. Wax comes in many forms such as cream, paste, and liquid. The basic properties of car wax can be attributed to a chemical compound called carnuba which has high amount of fatty acids in itself which gives the lustrous screen to the surface. It is this fatty acid in the chemical carnuba that creates a shield between the paint over the metallic surface and the material that tends to form over it modicum layer hence the surface is protected along with a beautiful luster. Artificial waxes mix low amounts of cleaners with high amounts of UV inhibitors to create protective layer that inhibits the hazardous action of sunlight over the vehicle surface. While a warm and wet look is achieved by carnuba, the man made artificial wax gives a high gloss look to a vehicle which makes it an eye catcher and head turner.

Scientists are everyday struggling to give more substitutes for the conventional chemicals for car wax. The ultimate objective of all these efforts is to develop an all encompassing product which give better protection and shiny looks to a vehicle and soon such car wax will be overshadowing the other products in the field.
