

## Hard Facts About Car Polish

Car polish is a must have product in your car care inventory. The reason is simple; everyone loves a shiny car and a good polish helps you get the brand new look back. Car polishes not only make your car look fresh, but also help protect the paint and prevent paint failure. Over time, dust, grime, grease, oil and bird hits accumulate on the exterior paint of a car. Just washing your car is not sufficient as most of these contaminants have acids and adhesive agents in them which stick to the car paint and slowly eat through the protective layer of paint exposing bare metal. Bare metal corrode easily leading to rusting of the car, reducing its life and resale value. Car polishes come in various forms and have varying ingredients. Almost all car polish has abrasive ingredients which help dislodge those hard to remove oil and grime spots. Some have fillers too to fill in the scratch marks.

Polishing a car is an involved process, a practiced procedure really. The first step is to wash the car. Wash first with plain water and then with a car specified detergent mix. Detergent used for washing clothes are never to be used as they are strong and may damage your car paint. Having washed your car with a car specified detergent mix, wash again with plain water and let the excess water fall off. Use a chamois leather car towel or a micro fiber car towel to dry your car. Having done that put the car polish evenly with an applicator brush which usually comes with your car polish product. There should be no gaps in the application of the car polish. Leave the car polish for the time specified in your products instructions. Then rub it off with a micro fiber towel to give you a good glow and a brand new look car.

The abrasive ingredients and dissolvent will remove the old grime oil and dust and the wax component in the car polish will give the requisite shine and protection. The wax component is also water repellant which will help protect your car paint. The question arises as to how often should someone polish a car. Well an interval of two to three weeks between polishing is all right. This is because every car polish has an abrasive component which acts by removing microns thick layer of paint to reveal a shiny layer and thus over time leads to the paint thinning and becoming dull. So a sensible interval between polishing is a must. Similar Entries "[title="I have more like this">Best car wax](#) | [Best car wax](#) | [Car](#) | [Auto](#) | [Waterless car wash](#) |
